

SYMSITES

Deliverable name: Showcases of the 4 EcoSites	
Deliverable number	D4.9
Official Date	31 May 2026
Submission Date	31 May 2026
Responsible partner	AITEX
Authors	AITEX, BEOF, BOKU, FSCSA, FOVASA, NTUA
Version	v1.0
Work package no.	4
Work package leader	AITEX
Dissemination level (PU/SEN)	PU

1. Objectives

The objective of this deliverable is to present the final video developed within the SYMSITES project as part of the activities carried out under Work Package 4 (WP4) – Design, operation and validation of the EcoSites.

This deliverable focuses exclusively on the production of a single audiovisual output aimed at showcasing the four EcoSites implemented in Spain, Denmark, Austria, and Greece, as a result of the design, operation, and validation of the pilot systems.

The video has been conceived to:

- visually demonstrate the implementation of the Industrial-Urban Symbiosis (I-US) concept at pilot scale,
- support the validation of the technologies and processes developed in the EcoSites, and provide an accessible representation of the project outcomes for dissemination and replication purposes.

2. Description of the work

The objective of this deliverable is to present the final video developed within the SYMSITES project as part of the activities carried out under Work Package 4 (WP4) – Design, operation and validation of the EcoSites.

This deliverable focuses exclusively on the production of a single audiovisual output aimed at showcasing the four EcoSites implemented in Spain, Denmark, Austria, and Greece, as a result of the design, operation, and validation of the pilot systems.

The video has been conceived to:

- visually demonstrate the implementation of the Industrial-Urban Symbiosis (I-US) concept at pilot scale,
- support the validation of the technologies and processes developed in the EcoSites,
- and provide an accessible representation of the project outcomes for dissemination and replication purposes.

The final video is publicly available at: <https://symsites.eu/discover-industrial-urban-symbiosis-with-symsites/>

3. Contribution to Project Impact

Given that this deliverable consists exclusively of a single audiovisual output, its contribution to the overall project impact is primarily supportive and complementary to the outcomes achieved in WP4.

- Support to WP4 validation outcomes

The video provides a visual synthesis of the EcoSites after completion of their design and operational phases. Its main contribution lies in facilitating the interpretation of the validated system configurations and the integration of the different technological components.

However, it should be noted that the video itself does not generate new technical results nor contribute directly to the validation process, but rather reflects and consolidates the outcomes obtained through the pilot activities.

- Technical communication of results

The combination of real footage and simplified technical schemes enables a structured presentation of the systems implemented at the EcoSites. This contributes to improving the clarity with which complex process interactions and system integrations can be understood.

This is particularly relevant for non-specialist stakeholders, although the level of detail is necessarily reduced compared to technical reports.

- Contribution to dissemination activities

While developed under WP4, the video supports dissemination activities by providing a concise and accessible representation of the EcoSites and the Industrial-Urban Symbiosis concept.

Its contribution is limited to serving as a communication tool that may be used in workshops, presentations, and digital dissemination channels. It does not, by itself, ensure dissemination outcomes but enables their implementation.

- Support to replication and transferability

The structured visualisation of the EcoSites' configurations may support the understanding of the project approach in different contexts. This can facilitate discussions on potential replication, particularly at a conceptual level.

However, the video does not provide sufficient technical detail for direct replication and should therefore be considered complementary to the technical documentation produced within the project.
